

PIGMENT POWERCOLOR

A pigment Powercolor is
a natural pigment in powder form.

There are 20 different colors
in the Powertex range.

The pigment must be dissolved / bound with a binder.

The binder may vary
depending on the color effect you want to get
and / or

the technique you want to apply.

The pigment becomes darker after the paint dried.
Mixed with varnish, the paint becomes waterproof.

The content of the Powercolor jars is 40 ml.

The density of the pigment Powercolor varies,
just like the volume.
